

EMF Vehicle Turntable

Installation Overview of turntable flush with drive

The turntable is constructed on a level, reinforced concrete pad 4.3 metres in diameter and 150mm thick. The pad needs to be 100mm below the desired finished driveway level. Drainage is required.

The turntable is covered in aluminium chequer plate fastened to sections of galvanised steel. The motor-drive box requires a drained concrete recess 480mm x 360mm x 520mm deep.

The turntable can be operated by remote control from within the vehicle.

The turntable operates from a single phase supply.

The vehicle turntable overcomes reversing down steep or awkward drives or onto busy roads. It is the solution to difficult access, tight parking spaces and increasing parking density.
